**Mastering the Game of Go without Human Knowledge**

DeepMind, 5 New Street Square, London EC1A 3TW.

*These authors contributed equally to this work.

A long-standing goal of artificial intelligence is an algorithm that learns, "tabula rasa," superhuman proficiency in challenging domains. Recently, AlphaGo became the first program to defeat a world champion in the game of Go. The tree search in AlphaGo evaluated positions and selected moves using deep neural networks. These neural networks were trained by supervised learning from human expert moves, and by reinforcement learning from self-play. Here, we introduce an algorithm based solely on reinforcement learning, without human data, guidance, or domain knowledge beyond game rules. AlphaGo becomes its own teacher: a neural network is trained to predict AlphaGo’s own move selections and also the winner of AlphaGo’s games. This neural network improves the strength of tree search, resulting in higher quality move selection and stronger self-play in the next iteration. Starting from the new program AlphaGo Zero achieved superhuman performance, winning 100-0 against the previously published, champion-defeating AlphaGo.

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
I. Motivation

How would you solve Go with classic supervised learning?

Why RL?
• Delayed labels
• Making sequences of decisions

What is RL?
• Automatically learn to make good sequences of decision
• Teaching by experience vs. Teaching by example.

Examples of RL applications

- Games
- Robotics
- Advertisement

<td><img src="image5.png" alt="Recycle Bin" /></td>
</tr>
</tbody>
</table>

**Goal**: maximize the return (rewards)

**Number of states**: 5

**Types of states**: initial, normal, terminal

**Agent’s Possible actions**:

- Define reward “r” in every state
  - +2 0 0 +1 +10

**Best strategy to follow if** $\gamma = 1$

**Additional rule**: garbage collector coming in 3min, it takes 1min to move between states

**How to define the long-term return?**

Discounted return:

$$R = \sum_{t=0}^{\infty} \gamma^t r_t = r_0 + \gamma r_1 + \gamma^2 r_2 + ...$$

Kian Katanforoosh
II. Recycling is good: an introduction to RL

What do we want to learn?

How good is it to take action 1 in state 2

\[
Q = \begin{pmatrix}
Q_{11} & Q_{12} \\
Q_{21} & Q_{22} \\
Q_{31} & Q_{32} \\
Q_{41} & Q_{42} \\
Q_{51} & Q_{52}
\end{pmatrix}
\]

\[Q-table\]

Assuming \( \gamma = 0.9 \)

Discounted return

\[
R = \sum_{t=0} \gamma^t r_t = r_0 + \gamma r_1 + \gamma^2 r_2 + \ldots
\]

Problem statement

Define reward “r” in every state

**What do we want to learn?**

how good is it to take action 1 in state 2

**Q-table**

Bellman equation (optimality equation)

\[ Q^*(s, a) = r + \gamma \max_{a'}(Q^*(s', a')) \]

**Policy**

\[ \pi(s) = \arg \max_a(Q^*(s, a)) \]

When state and action spaces are too large, this method has huge memory cost

Function telling us our best strategy

Kian Katanforoosh
What we’ve learned so far:

- Vocabulary: environment, agent, state, action, reward, total return, discount factor.

- Q-table: matrix of entries representing “how good is it to take action a in state s”

- Policy: function telling us what’s the best strategy to adopt

- Bellman equation satisfied by the optimal Q-table
I. Motivation

II. Recycling is good: an introduction to RL

III. Deep Q-Learning

IV. Application of Deep Q-Learning: Breakout (Atari)

V. Tips to train Deep Q-Network

VI. Advanced topics
III. Deep Q-Learning

**Main idea:** find a Q-function to replace the Q-table

**Problem statement**

![Diagram of states and actions](image)

**Q-table**

\[
Q = \begin{pmatrix}
0 & 0 \\
2 & 9 \\
8.1 & 10 \\
9 & 10 \\
0 & 0
\end{pmatrix}
\]

### Neural Network

**Neural Network**

Then compute loss, backpropagate.

\[
s = \begin{pmatrix}
0 \\
1 \\
0 \\
0 \\
0
\end{pmatrix}
\]

How to compute the loss?
III. Deep Q-Learning

\[ Q^*(s,a) = r + \gamma \max_{a'} (Q^*(s',a')) \]

**Loss function**

\[ L = (y - Q(s, \leftarrow))^2 \]

**Target value**

CASE: \( Q(s, \leftarrow) > Q(s, \rightarrow) \)

\[ y = r_{\leftarrow} + \gamma \max_{a'} (Q(s_{\text{next}}^{\leftarrow}, a')) \]

CASE: \( Q(s, \leftarrow) < Q(s, \rightarrow) \)

\[ y = r_{\rightarrow} + \gamma \max_{a'} (Q(s_{\text{next}}^{\rightarrow}, a')) \]

Immediate reward for taking action \( \leftarrow \) in state \( s \)

Discounted maximum future reward when you are in state \( s_{\text{next}}^{\leftarrow} \)

Hold fixed for backprop

[Francisco S. Melo: Convergence of Q-learning: a simple proof]
### III. Deep Q-Learning

**Loss function (regression)**

\[ L = (y - Q(s, \rightarrow))^2 \]

**Target value**

**Case:** \( Q(s, \leftarrow) > Q(s, \rightarrow) \)

\[ y = r_{\leftarrow} + \gamma \max_{a'}(Q(s_{\leftarrow}^{\text{next}}, a')) \]

**Backpropagation**

Compute \( \frac{\partial L}{\partial W} \) and update W using stochastic gradient descent

**Case:** \( Q(s, \leftarrow) < Q(s, \rightarrow) \)

\[ y = r_{\rightarrow} + \gamma \max_{a'}(Q(s_{\rightarrow}^{\text{next}}, a')) \]
**DQN Implementation:**

- Initialize your Q-network parameters

- Loop over episodes:
  - Start from initial state $s$

- Loop over time-steps:
  - Forward propagate $s$ in the Q-network
  - Execute action $a$ (that has the maximum $Q(s,a)$ output of Q-network)
  - Observe reward $r$ and next state $s'$
  - Compute targets $y$ by forward propagating state $s'$ in the Q-network, then compute loss.
  - Update parameters with gradient descent

\[ y = r + \gamma \max_{a'} Q(s_{next}^{next}, a') \]
I. Motivation

Recap’ (+ preprocessing + terminal state)

**DQN Implementation:**

- Initialize your Q-network parameters
- Loop over episodes:
  - Start from initial state $s$
  - Loop over time-steps: $\phi(s)$
    - Forward propagate $s$ in the Q-network $\phi(s)$
    - Execute action $a$ (that has the maximum $Q(s, a)$ output of Q-network) $\phi(s)$
    - Observe reward $r$ and next state $s'$
    - **Use $s'$ to create** $\phi(s')$
    - Compute targets $y$ by forward propagating state $s$ in the Q-network, then compute loss. $\phi(s')$
    - Update parameters with gradient descent

**Some training challenges:**
- Keep track of terminal step
- Experience replay
- Epsilon greedy action choice (Exploration / Exploitation tradeoff)

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
Recap’ (+ preprocessing + terminal state)

**DQN Implementation:**

- Initialize your Q-network parameters
- Loop over episodes:
  - Start from initial state
  - Loop over time-steps:
    - Forward propagate \( s \) in the Q-network
    - Execute action \( a \) (that has the maximum \( Q(s, a) \) output of Q-network)
    - Observe reward \( r \) and next state \( s' \)
    - **Use \( s' \) to create** \( q(s') \)
    - Compute targets \( y \) by forward propagating state \( s' \) in the Q-network, then compute loss.
    - Update parameters with gradient descent

**Some training challenges:**
- Keep track of terminal step
- Experience replay

  (Exploration / Exploitation tradeoff)

\[ \phi(s) \]
\[ \phi(s') \]

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
Recap’ (+ preprocessing + terminal state)

**DQN Implementation:**
- Initialize your Q-network parameters
- Loop over episodes:
  - Start from initial state $\phi(s)$
  - **Create a boolean to detect terminal states: terminal = False**
  - Loop over time-steps:
    - Forward propagate $s$ in the Q-network $\phi(s)$
    - Execute action $a$ (that has the maximum $Q(s,a)$ output of Q-network)
    - Observe reward $r$ and next state $s'$
    - Use $s'$ to create $\phi(s')$
    - **Check if $s'$ is a terminal state.** Compute targets $y$ by forward propagating state $s'$ in the Q-network, then compute loss.
- Update parameters with gradient descent

**Some training challenges:**
- Keep track of terminal step
- Experience replay
- Epsilon greedy action choice (Exploration / Exploitation tradeoff)

\[
\begin{align*}
\text{if} & \text{ terminal } = \text{False} : \quad y = r + \gamma \max_{a'} Q(s', a') \\
\text{if} & \text{ terminal } = \text{True} : \quad y = r \quad \text{(break)}
\end{align*}
\]

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
IV - DQN training challenges

Experience replay

Current method is to start from initial state $s$ and follow:

1. Experience (leads to one iteration of gradient descent)

<table>
<thead>
<tr>
<th>State</th>
<th>Action</th>
<th>Reward</th>
<th>Next State</th>
</tr>
</thead>
<tbody>
<tr>
<td>$E_1$</td>
<td>$\phi(s)$</td>
<td>$a$</td>
<td>$r$</td>
</tr>
<tr>
<td>$E_2$</td>
<td>$\phi(s')$</td>
<td>$a'$</td>
<td>$r'$</td>
</tr>
<tr>
<td>$E_3$</td>
<td>$\phi(s'')$</td>
<td>$a''$</td>
<td>$r''$</td>
</tr>
</tbody>
</table>

Training: $E_1 \rightarrow E_2 \rightarrow E_3$

Can be used with mini batch gradient descent

Advantages of experience replay?

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
Recap’ (+ experience replay)

**DQN Implementation:**
- Initialize your Q-network parameters
- Initialize replay memory D
- Loop over episodes:
  - Start from initial state \( \phi(s) \)
  - Create a boolean to detect terminal states: terminal = False
- Loop over time-steps:
  - Forward propagate \( \phi(s) \) in the Q-network
  - Execute action \( a \) (that has the maximum \( Q(\phi(s), a) \) output of Q-network)
  - Observe reward \( r \) and next state \( s' \)
  - Use \( s' \) to create \( \phi(s') \)
  - **Add experience** \( (\phi(s), a, r, \phi(s')) \) to replay memory (D)
- **Sample random mini-batch of transitions from D**
  - Check if \( s' \) is a terminal state. Compute targets \( y \) by forward propagating state \( \phi(s') \) in the Q-network, then compute loss.
  - Update parameters with gradient descent

**Some training challenges:**
- Keep track of terminal step
- Experience replay
- Epsilon greedy action choice (Exploration / Exploitation tradeoff)

The transition resulting from this is added to D, and will not necessarily be used in this iteration’s update!

Update using sampled transitions

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
Exploration vs. Exploitation

Just after initializing the Q-network, we get:

- $Q(S1, a_1) = 0.5$
- $Q(S1, a_2) = 0.4$
- $Q(S1, a_3) = 0.3$
Exploration vs. Exploitation

Just after initializing the Q-network, we get:

\[ Q(S1, a_1) = 0 \]
\[ Q(S1, a_2) = 0.4 \]
\[ Q(S1, a_3) = 0.3 \]
Exploration vs. Exploitation

Just after initializing the Q-network, we get:

\[
Q(S_1, a_1) = 0.5
\]

\[
Q(S_1, a_2) = 0.4
\]

\[
Q(S_1, a_3) = 0.3
\]
Exploration vs. Exploitation

Just after initializing the Q-network, we get:

\[ Q(S1, a_1) = 0.5 \]
\[ Q(S1, a_2) = 0.4 \]
\[ Q(S1, a_3) = 0.3 \]

Will never be visited, because \( Q(S1, a_3) < Q(S1, a_2) \)
Recap’ (+ epsilon greedy action)

DQN Implementation:

- Initialize your Q-network parameters
- Initialize replay memory D
- Loop over episodes:
  - Start from initial state $\phi(s)$
  - Create a boolean to detect terminal states: terminal = False
  - Loop over time-steps:
    - With probability epsilon, take random action $a$.
    - Otherwise:
      - Forward propagate $\phi(s)$ in the Q-network
      - Execute action $a$ (that has the maximum $Q(\phi(s), a)$ output of Q-network).
    - Observe reward $r$ and next state $s'$
    - Use $s'$ to create $\phi(s')$
    - Add experience $(\phi(s), a, r, \phi(s'))$ to replay memory (D)
    - Sample random mini-batch of transitions from D
    - Check if $s'$ is a terminal state. Compute targets $y$ by forward propagating state $\phi(s')$ in the Q-network, then compute loss.
    - Update parameters with gradient descent

[Mnih, Kavukcuoglu, Silver et al. (2015): Human Level Control through Deep Reinforcement Learning]
Overall recap’

**DQN Implementation:**
- Initialize your Q-network parameters
- Initialize replay memory D
- Loop over episodes:
  - Start from initial state $\phi(s)$
  - Create a boolean to detect terminal states: $\text{terminal} = \text{False}$
  - Loop over time-steps:
    - With probability epsilon, take random action $a$.
    - Otherwise:
      - Forward propagate $\phi(s)$ in the Q-network
      - Execute action $a$ (that has the maximum $Q(\phi(s), a)$ output of Q-network).
  - Observe rewards $r$ and next state $s'$
  - Use $s'$ to create $\phi(s')$
  - Add experience $(\phi(s), a, r, \phi(s'))$ to replay memory $(D)$
  - Sample random mini-batch of transitions from $D$
  - Check if $s'$ is a terminal state. Compute targets $y$ by forward propagating state $\phi(s')$ in the Q-network, then compute loss.
  - Update parameters with gradient descent
